

# IOGP feedback to the public consultation on the Net-Zero Industry Act Delegated Act on primarily used components

IOGP Europe welcomes the Commission's Delegated Act on primarily used components under the Net-Zero Industry Act (NZIA), as well as the opportunity to collaborate with EU institutions by providing technical input. This is an important step to allow an appropriate implementation of the NZIA Regulation allowing net-zero technologies, key for Europe's decarbonization, to benefit from the Regulation's provisions.

## Overly restrictive criteria for "primarily used components"

- We would like to point out that the proposed criteria defining "primarily used components", as included in the Commission Staff Working Document (SWD), are, from our perspective, overly restrictive and inconsistently applied throughout the Annex.

## Adoption of pragmatic criteria to include key net-zero components

- One particular concern is the requirement that a specific component's production output must be "always" intended for net-zero purposes. We believe this approach is excessively strict and may lead to the unintended consequence of excluding key components that play a fundamental role in net-zero infrastructure. A strict classification of net-zero technologies could also create a mismatch between net-zero projects and the technologies they rely on. For instance, while certain projects may qualify as net-zero strategic projects, the technologies underpinning their operability may not be explicitly recognized under the current classification. This discrepancy would result in increased costs, limited incentives, and regulatory uncertainty, ultimately slowing down the scaling of net-zero investments, in particular CCS and blue hydrogen projects. Rather than excluding components

whose production is not exclusively for net-zero purposes (e.g., CO<sub>2</sub> pipelines, CO<sub>2</sub> compressors, CO<sub>2</sub> ships), we suggest adopting a more pragmatic criteria that includes components that are critical for low-carbon technologies and for the EU's net-zero pathway resilience.

- With regards to hydrogen, we noticed that hydrogen compressors and transport pipelines although not explicitly listed in the Annex, in the SWD they are specifically referred to as components meeting the criteria for primarily used components. This contradicts the exclusion of CO<sub>2</sub> compressors and pipelines as primarily used component under CCS technologies in the Annex.
- Similarly, certain technologies exclusive to the CO<sub>2</sub> domain — such as CO<sub>2</sub> vessels and specific measurement instruments — are absent from the list. A more technology-neutral and forward-looking approach to all net-zero technologies should be applied to ensure that essential CCS-related components are not unduly excluded.

## Inclusion of components to the list of final products in the Annex

- Based on the broad definition of "final products" foreseen in the NZIA (Article 2.10), we identified specific types of final products to be included in the list to provide greater clarity and prevent any ambiguity, listed in the table below.

## Keep the list adaptable to technological developments

- In accordance with Article 46.7 of the NZIA, which allows for the revision of the list to reflect technological developments, we emphasize the importance of keeping this list adaptable and subject to periodic review.

Please find below concrete proposals for changes to the Delegated Act and its Annex.

Text of the Delegated Act	IOGP proposal for amendment
<p>(Recital 5) To identify specific components considered to be primarily used for the production of net-zero technologies, four criteria were put forward: specific, commercial availability, always primarily used and essential.</p>	<p>(Recital 5) To identify specific components considered to be primarily used for the production of net-zero technologies, four criteria were put forward: specific, commercial availability, <del>always</del> primarily used and essential.</p>

Text of the Annex of the Delegated Act	IOGP proposal for amendment – inclusion of additional items	Justification
<p><b>List of final products for carbon storage technologies</b></p>	<ul style="list-style-type: none"> <li>• Injection wells: wells used to inject compressed carbon dioxide deep into geological formations</li> <li>• MMV (Measurement, Monitoring and Verification) Technologies during and after operations</li> <li>• Low Carbon Offshore Energy generation for platforms</li> <li>• Offshore CO<sub>2</sub> injection units</li> <li>• CO<sub>2</sub> storage through in-situ mineralization</li> <li>• CO<sub>2</sub> well drilling &amp; completion equipment</li> <li>• CO<sub>2</sub> compressors</li> <li>• CO<sub>2</sub> pumps</li> <li>• CO<sub>2</sub> sensors</li> <li>• AI-powered real-time exception diagnostics</li> </ul>	<ul style="list-style-type: none"> <li>• <b>CO<sub>2</sub> injection systems:</b> Includes the completions (all subsurface equipment that establishes and controls the CO<sub>2</sub> well, specifically created with materials and controls for CO<sub>2</sub> flow), wellheads (created for CO<sub>2</sub> use with different materials and specifications (e.g., lower temperature requirements), trees (also created specifically for CO<sub>2</sub> flow), controls (adapted to the different conditions that CO<sub>2</sub> induces, such as phase changes and chemical states that need to be avoided in static and dynamic conditions), and valves (capable of taking the extreme low temperatures for the emergency cases in CO<sub>2</sub> flow. All this equipment is very specific to geology, geography, surface or subsea, and the temperature and flow conditions, and there are now similar components.</li> <li>• <b>CO<sub>2</sub> well drilling equipment:</b> Certain elements of the well drilling and monitoring equipment are designed and used only for CO<sub>2</sub> wells.</li> </ul>
	<p><b>Subcategorie of net-zero technologies:</b></p> <ul style="list-style-type: none"> <li>• Carbon capture and <b>carbon dioxide removal technologies</b></li> </ul>	

Text of the Annex of the Delegated Act	IOGP proposal for amendment – inclusion of additional items	Justification
	<p><b>List of final products for Carbon capture and carbon dioxide removal technologies</b></p> <ul style="list-style-type: none"> <li>• Solvent capture</li> <li>• Sorbent capture</li> <li>• Membranes</li> <li>• Cryogenic systems</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Solvent-based</b> capture solutions deploy plant schemes that typically include: <ul style="list-style-type: none"> <li>– Absorption /desorption <b>columns</b> that (1) put in contact, thanks to an <b>internal</b> contactor, flue gas and solvent to allow CO<sub>2</sub> absorption (2) host the CO<sub>2</sub> regeneration, typically by <b>steam</b> from a <b>reboiler</b>. Those columns represent a major part of the plant CAPEX and footprint - process intensifications solutions may be adopted (e.g. rotating packing beds)</li> <li>– A main <b>heat exchanger</b> is needed to transfer heat from the lean solvent (depleted) to the rich solvent (containing CO<sub>2</sub>), heat exchangers are needed to cool-down the stripped CO<sub>2</sub> and condensed the water, heat exchangers are also used to control the temperature of the absorber and remove heat from the exothermic reaction. Heat exchangers might be needed to cool down flue gas at columns inlet temperature, but this is usually done through a direct contact cooler (column), additional ones may be needed depending on specific process.</li> <li>– <b>Heat pumps</b> may recover heat from host plant or nearby heat sources to generate steam.</li> <li>– <b>Compressors/expanders</b> may be needed depending on process configurations, blowers are required to circulate the flue gas or the air through the capture system.</li> <li>– <b>Pumps</b> are needed to circulate the solvent from the absorption to the regeneration sections and vice-versa, and to circulate the water used for refrigeration/heating purposes.</li> </ul> </li> </ul>

<p><b>List of primarily used components for CO<sub>2</sub> transport technologies</b></p>	<ul style="list-style-type: none"> <li>• CO<sub>2</sub> compressors</li> <li>• CO<sub>2</sub> liquefaction plants/system</li> <li>• MP and LP Ships: metallurgy and joint designs</li> <li>• Cryo Flexible Pipelines</li> <li>• Fluidized bed reactors, Air pollution control components such as Catalytic Oxidiser (RCO), Regenerative Thermal Oxidiser (RTO), DeNOX units</li> <li>• CO<sub>2</sub> flow meters</li> <li>• CO<sub>2</sub> conditioning technologies (e.g., compressors, liquefaction units, CO<sub>2</sub> purification units, removal of impurities, disposal thereof)</li> <li>• CO<sub>2</sub> monitoring devices</li> <li>• CO<sub>2</sub> quality monitoring (analysers for impurities, online and batch)</li> <li>• CO<sub>2</sub> booster pumps</li> <li>• CO<sub>2</sub> vaporizers and condensers</li> <li>• CO<sub>2</sub> heat exchange and heating systems</li> <li>• CO<sub>2</sub> qualified pigging and other inspection tools</li> <li>• CO<sub>2</sub> leak detection systems (facilities and pipelines)</li> <li>• CO<sub>2</sub> qualified meters</li> <li>• CO<sub>2</sub> pumps</li> <li>• CO<sub>2</sub> liquefaction plants</li> <li>• Liquid CO<sub>2</sub> Shipping by different carriers</li> <li>• Offshore &amp; onshore loading systems</li> <li>• CO<sub>2</sub> conditioning and treatment</li> <li>• CO<sub>2</sub> tanks</li> </ul>	<ul style="list-style-type: none"> <li>• <b>CO<sub>2</sub> pipelines</b> will be necessary to enable the efficient transport of CO<sub>2</sub> from capture facilities to dedicated storage sites, playing a key role in supporting CCS initiatives.</li> <li>• <b>CO<sub>2</sub> Compression:</b> CO<sub>2</sub> compression is a vital process in CCS, where captured CO<sub>2</sub> is compressed to high pressure for easier transport through pipelines. Proper compression ensures the CO<sub>2</sub> remains in a dense, supercritical state, which significantly reduces its volume and enhances transport efficiency. Developing reliable compression technologies will be essential to support large-scale CO<sub>2</sub> transportation networks.</li> <li>• <b>CO<sub>2</sub> Liquefaction:</b> CO<sub>2</sub> liquefaction involves cooling and pressurizing CO<sub>2</sub> until it transitions into a liquid state for storage or transport. This process is particularly useful for shipping CO<sub>2</sub> over long distances where pipelines are not feasible. Expanding liquefaction capacity at key ports will be crucial to enabling the large-scale transport of CO<sub>2</sub> and supporting global decarbonization goals.</li> <li>• <b>CO<sub>2</sub> Monitoring Devices:</b> CO<sub>2</sub> monitoring devices play a crucial role in tracking and ensuring the safe and efficient operation of carbon capture, transport, and storage systems. These devices measure CO<sub>2</sub> levels in real time to detect leaks, monitor pipeline integrity, and verify storage performance. Advanced monitoring technology is essential to meet regulatory standards, enhance safety, and build trust in large-scale CO<sub>2</sub> management projects.</li> </ul>

Text of the Annex of the Delegated Act	IOGP proposal for amendment – inclusion of additional items	Justification
<p><b>List of other hydrogen technologies list of primarily used components</b></p>	<ul style="list-style-type: none"> <li>• H2 storage in salt caverns</li> <li>• Technologies/sensors for hydrogen emission monitoring</li> <li>• AI-powered digital solutions for real-time energy system optimization</li> <li>• Technologies to improve energy efficiency in hydrogen carrier systems</li> </ul>	
<p><b>List of other hydrogen technologies list of final products</b></p>	<ul style="list-style-type: none"> <li>• Gas turbines for 100% H2 use</li> <li>• Hydrogen turbines</li> <li>• Hydrogen pipelines</li> <li>• Ammonia cracker</li> <li>• Hydrogen liquefaction technologies</li> <li>• Hydrogen refueling technologies</li> <li>• Hydrogen storage (pressurized, cryogenic/liquid)</li> <li>• Hydrogen shipping vessels (barges for inland waterways, large-scale international vessels)</li> <li>• Loading arm for liquid hydrogen terminals</li> <li>• Hydrogen carriers (ammonia, liquid hydrogen, LOHC)</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Hydrogen Gas turbines</b> have the same applications as fuel cells and can be operated more flexibly. European companies are leading technology developments and manufacturing of hydrogen-ready turbines. Hydrogen gas turbines will play an important role in providing flexibility for the electricity system in times of low variable renewables supply and high electricity demand. Hydrogen gas turbines will be also used in hydrogen pipelines (H2 backbone) and to decarbonize natural gas production operations. This is recognized by countries like Germany that foresee an important role for hydrogen gas turbines and engines in ensuring reliability in their electricity system. Furthermore, hydrogen turbines will be required by transmission system operators for hydrogen.</li> <li>• <b>Hydrogen pipelines:</b> Europe currently has around 206.737km of gas transmission pipelines and 1,600 km of hydrogen pipelines, with 3,300 km being currently developed across Austria, Germany, and Italy. To future-proof these infrastructures, advanced materials specifically designed for CO<sub>2</sub> and hydrogen transport will be essential.</li> </ul>
